1. Park on a level concrete surface with the tires straight and steering wheel locked in the center position.
2. Block/chuck the rear wheels, both in front and behind the tire to prevent vehicle movement.
3. Jack the front end up and secure the vehicle on suitable large jack stands from the frame on both sides.
4. Remove the front skid plate from vehicle.
5. Remove both front wheels/tires.
6. Remove the lower shock nut and bolt.

7. Remove the top three nuts holding the coilover to the shock tower.
8. Before compressing the coils, note the alignment of the top plate stud in relation to the lower shock eyelet hole. The stud which is closest to the engine is aligned directly down the center of the strut body, 90 degrees from the bottom shock eyelet hole center.

9. Secure and compress the coil over using a suitable spring compressor. **NOTE: IF YOU DO NOT HAVE A HEAVY DUTY SPRING COMPRESSOR OR THE EXPERIENCE REQUIRED TO COMPRESS COIL SPRINGS, IT IS RECOMMENDED THAT YOU TAKE THE COILOVER TO A QUALIFIED SERVICE PROFESSIONAL! MANY PARTS STORES AND AUTOMOTIVE CENTERS CAN PROVIDE THIS SERVICE.**

10. Remove the top nut holding the coilover assembly together. Remove all washers, bushings, spring isolator, and top plate from coil-over assembly. **Note in what order all washers, bushings, top plate, and spring isolator come off the shock shaft. Both above and below the top plate. Re-assembly of these parts must be accomplished in the same order. The spring isolator always goes next to the spring!**

11. **3" LIFT KITS ONLY**- Remove the three top plate studs on each of the top plates. This can be accomplished with a vice and large deep socket, or by placing a large deep socket on the concrete and hammering them out. Replace O.E. studs with new longer bolts supplied in your kit.
12. Compress the spring further to allow the install of your new lift spacer. Install the shock, washers, bushings, spring isolator, lift spacer, top plate, remaining washers, bushings, and top nut in the reverse order as disassembly. **Double check that the top plate bolt is aligned correct with the bottom of the shock before and during uncompressing the coil.** See step #11
Repeat assembly for the other side.

13. **3” LIFT KITS ONLY**- Install the new top plate spacer provided on top of the coilover assembly.
14. Position the coilover onto the vehicle, sliding the top into the shock tower first. Install the top three nuts which hold the coilover to the shock tower finger tight. Install the lower shock bolt and nut. **You may need to pry down on the upper control arm in order to get the lower shock bolt installed.** Torque upper nuts and lower bolt/nut to manufacture specs.

15. If your kit came with a front diff drop kit, now is good time to install it.
16. Reinstall the wheels/tires, and the skid plate. Torque all nuts and bolts to manufacturer specs.
17. Recheck the torque of all bolts/nuts which have been taken apart during the installation of this lift after 15 miles, and periodically thereafter.

**A front end alignment must be performed after install.**
